

Patent for Hair regrowth molecule.

Indian Facial Plastic surgeon Dr. Debraj Shome and cosmetic dermatologist Dr. Rinky Kapoor have recently received the US patent for their hair regrowth molecule.

This molecule stimulates the hair follicles to grow. This treatment is effective in Male pattern androgenetic alopecia, female pattern hair loss, alopecia areata and some cases of secondary alopecia. The doctors have been working on this molecule since 2010.

Since 2010, Dr. Shome and Dr. Kapoor have treated 10000 patients with this treatment and out of this 100 patients had post chemotherapy hair loss. They have got the US patent for the QR678 hair regrowth molecule. Dr. Shome says that cosmetic treatments for hair loss have limitations. They cannot revive the hair. QR678 not only stops hair fall but also stimulates regrowth. This molecule will be available to trained cosmetologists for use in their patients. This treatment will most benefit patients who have lost hair post chemotherapy and those who are troubled with excessive hair loss. This treatment can help bring back confidence in patients who are fighting the many aspects of cancer.
