

A shot in the scalp

A new injection therapy uses growth factors to grow new hair and prevent hair loss

BY DR DEBRAJ SHOME

It is always hard to watch unusual hair loss and it is more depressing if it leads to baldness. Both men and women tend to try various treatments, but finding the right solution is not that easy. Early baldness in men and women is no more considered rare. Hair loss could be due to many reasons—genetic, age, medication, hormone changes, vitamin deficiency, fungal infections, etc. But hair loss is no longer incurable. With

advances in the science of trichology, there are more effective solutions for hair loss.

The most recent cure for hair loss is a technology that promotes natural hair growth with an injection. A technology called QR 678, which recently won a US patent, is becoming popular. The treatment has been clinically proven to revitalise the scalp using naturally derived molecules, signalling the cells to grow more hair.

This has already become popular in Bollywood circles. Similar non-surgical interventions are going to change the landscape of hair growth services in the country.

What is QR 678 treatment?

QR 678 treatment is an advanced method that facilitates hair growth, while preventing hair loss. The key ingredient of this treatment is a mixture of several growth factors which are involved in stimulating hair growth
